

How to heat your furnace and not our planet?

We have some ideas.

REBOX® Oxyfuel. Solutions for reducing emissions hazardous to the environment.

Fact is we're all under pressure to minimise the emission of hazardous gases. Which is why you should talk to us about your options. We can enlighten you on the fact that applying oxygen combustion in a metallurgical heating or melting process lowers the emissions of CO₂ and NO_x while decreasing fuel consumption.

Our Oxyfuel-based solutions are designed to help you achieve the same process results with less fuel consumption, reduced harmful emissions and even increased process capacity. It's no wonder there are several hundred AGA Oxyfuel installations within heating and melting applications around the world today.

AGA – ideas become solutions.
